

Balancing Political Bias in News Article Retrieval

Thomas Jahoda

- IR Pipeline & evaluation
- Political balance metric & ranking correction methods

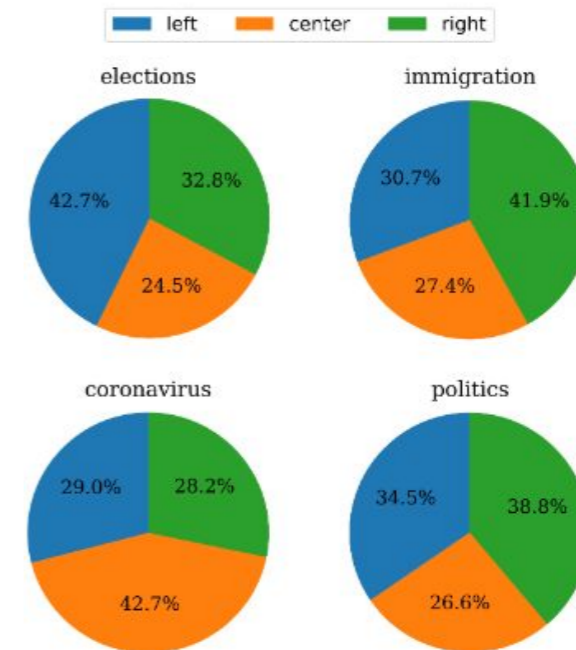

Raphael Rogi

- Dataset analysis & preprocessing
- Bias-classifier

[Project Repository](#)

Motivation

- The viewpoint of authors and news outlets influences how a story is told
- Consuming news only from one side can lead to extreme political ideology
- It is important to make the reader aware of political bias
- Balance bias in search results

Overview

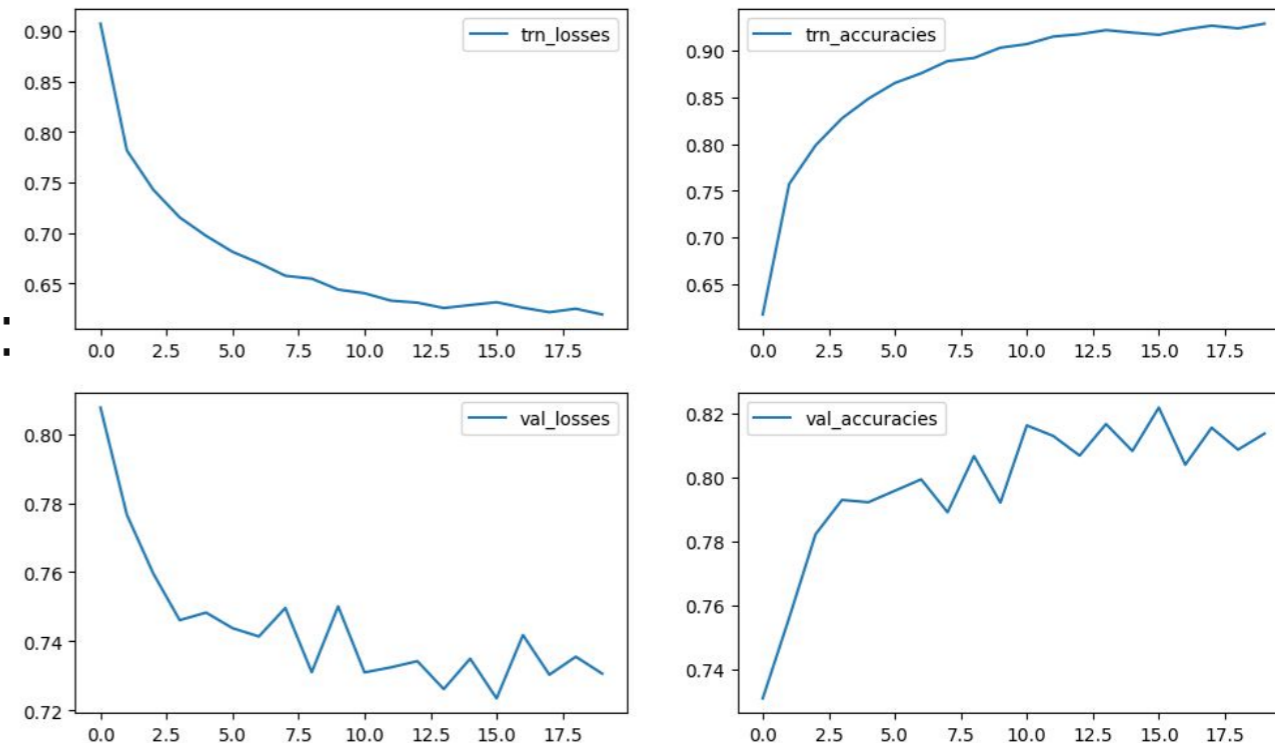

Political Bias Classification

- inspired by “*We Can Detect Your Bias: Predicting the Political Ideology of News Articles*”
- classifier on top of BERT
- classes: left, center, right
- almost reproduced test accuracy: 77% / 79.83%

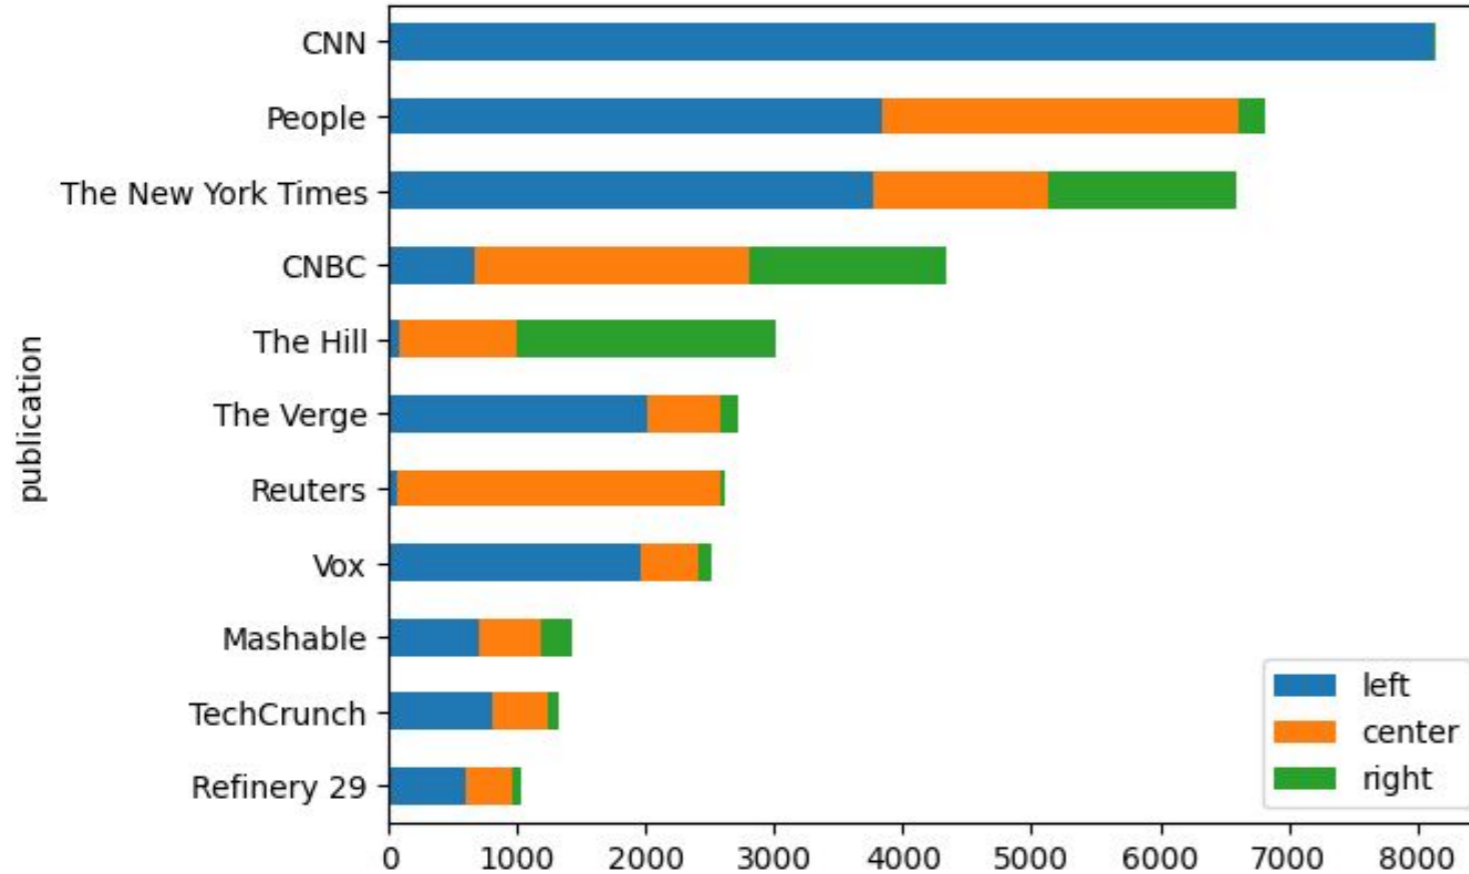

Political Ideology	Count	Percentage
Left	12,003	34.6%
Center	9,743	28.1%
Right	12,991	37.3%

Article-Bias-Prediction dataset

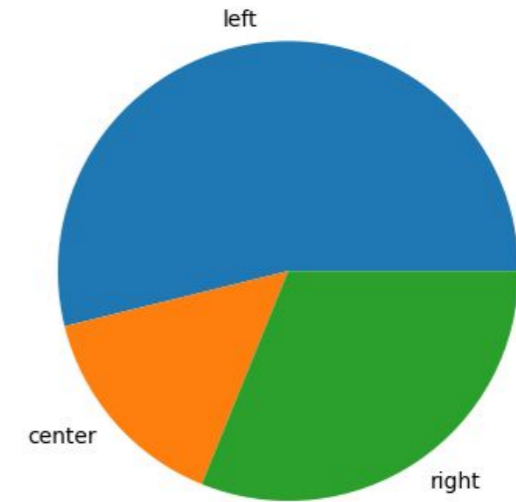

Training process over 20 epochs

Analysis of IR-Eval Dataset

Publisher bias (created using bias-classifier) for outlets with 1000 or more publications

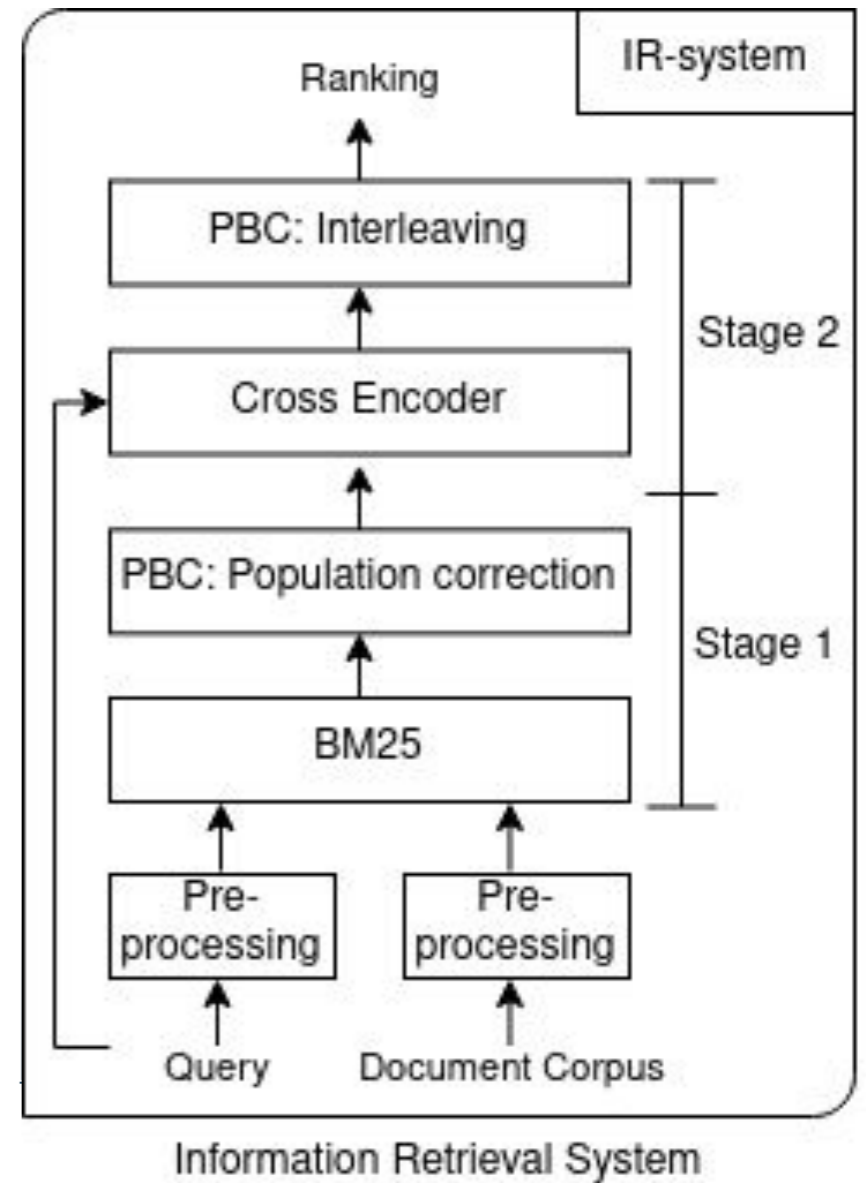

Overall bias (created using bias-classifier)

#relevant docs	how often found
1	29716
2	5844
3	1001
4	114
5	8

Query relevance (created when combining with the NewsSHed dataset)

IR Pipeline

- Simple two-stage IR pipeline
 - S1: Okapi BM25
 - S2: pre-trained cross-encoder
- Political bias correction (PBC) methods in each stage
 - S1: ensure configured minimum docs for each class
 - S2: interleave top `interleave_k` docs by bias class (alternating if possible)

Political Balance Metric for Search Results

- position-sensitive
- class-based
(left/center/right)
- normalized
- intuitive
- probability-based

Political Balance Metric for Search Results

(proposed new metric)

- position-sensitive
- class-based
(left/center/right)
- normalized
- intuitive
- probability-based
(but we used one-hot encoded probs in the eval pipeline)

k ... Number of retrieved documents

c ... Class count (usually 3 for 'left', 'center', 'right')

P_{ij} ... Probability of document i being in class j

DCG@k (rel) ... DCG@k for relevance scores $\text{rel} \in \mathbb{R}^k$

$$d_j = \frac{\text{DCG@k} \left((P^T)_j \right)}{\sum_{l=1}^c \text{DCG@k} \left((P^T)_l \right)} \dots \text{Class representation distribution } \vec{d}$$

$$\vec{d} \in \mathbb{R}^c, \sum_{j=1}^c d_j = 1$$

$$b = 1 - \frac{\widehat{\text{Var}}(\vec{d})}{\underbrace{\widehat{\text{Var}} \left(\begin{bmatrix} 1, \underbrace{0, \dots, 0}_{c-1 \text{ times}} \end{bmatrix} \right)}_{\text{worst-case variance}}} \dots \text{Class Balance in Rankings, } b \in [0, 1]$$

$b \approx 0.999$ for [l, r, c, c, r]
 $b = 0$ for [l, l, l, l, l]
 $b \approx 0.34$ for [l, l, l, l, r]
 $b \approx 0.66$ for [l, l, l, c, r]
 $b \approx 0.96$ for [c, r, l, l, l]

Evaluation Results (mean values, rounded to 3 decimals, N=1000 queries)

k = 50, PBC stage_1_min_fraction_per_class = 20%, PBC stage_2_interleave_k = 10

mean(actual relevant doc count) = 3.1

mean(optimal political balance for optimal IR pipeline) = 0.620

Future work

- **Evaluate** our **proposed metric** based on different scenarios and let some statistics expert verify whether it makes sense
- **Evaluate PBC** methods more intensely
 - using SOTA IR-system
 - using different parameters for PBC methods
 - compare resulting rankings w/ and w/o PBC while ignoring actual relevant docs
 - w/ and w/o PBC on ranking-focused datasets (e.g. some news subset of MS MARCO)
 - use established and peer-reviewed metrics for diversity and popularity in search results
- More advanced PBC methods sensitive to relevance-score for reranking

Conclusion

- Proposed **tunable** methods for political bias correction in rankings
- Proposed intuitive metric for **measuring political balance in search results**
- **Prototype** for **enhancing end-to-end IR pipeline** with PBC methods
 - current results do not show a clear favorable trade-off (!)
 - larger drop in nDCG than rise in masked political balance
 - evaluation on **more suitable dataset** (more relevant documents per query) necessary
